ProctorAI: Complete Project Overview

🎯 What is This Project?

ProctorAI is a real-time AI exam proctoring system that watches students taking online exams and automatically detects signs of cheating or suspicious behavior.

Think of it like having an intelligent security camera that:

- Watches for specific cheating indicators (phones, looking away, etc.)
- Keeps track of concerning patterns
- Alerts human administrators so they can make final decisions about whether to approve or flag a student

---

🤔 Problem It Solves

The Challenge: Online exams can't prevent cheating the way in-person exams do. A student could:

- Use their phone to look up answers
- Have someone else help them
- Look around nervously (indicating dishonest intent)
- Switch browser tabs to access unauthorized resources

The Solution: ProctorAI adds an "intelligent observer" that:

1. **Detects** suspicious behaviors in real-time (using AI/computer vision)
2. **Scores** the risk level based on what it observes (using weighted scoring)
3. **Tracks** patterns over time (using a 30-minute window)
4. **Alerts** administrators when risk gets high enough for manual review

---

⏳ How the Project is Structured

Three Main Layers

```
┌──────────────────────────────────┐
│    STUDENT INTERFACE             │  ← What students see
│  (React/TypeScript Frontend)     │
└──────────────────────────────────┘

              ↕ (REST API calls)

┌──────────────────────────────────┐
│  AI DETECTION ENGINE             │  ← What watches students
│  (Node.js/Express Backend)       │
└──────────────────────────────────┘

              ↕ (Database queries)

┌──────────────────────────────────┐
│   DATA STORAGE                   │  ← Where info is saved
```

```
│  (MongoDB)                          │
└──────────────────────────────────────┘
```

📱 The Student Journey (6 Steps)

Step 1: Credentials & Enrollment

- Student enters: name, student ID, email, program
- **Purpose**: Identify who's taking the exam
- **Technology**: Simple HTML form validation

Step 2: Pre-Exam System Check

- Camera validation (does camera work?)
- Lighting assessment (can we see the face clearly?)
- Face positioning check (is face in center of frame?)
- Single-person detection (is only ONE person in frame?)
- **Identity verification via face matching** (is this REALLY the enrolled student's face?)
- **Purpose**: Ensure technical setup is good AND verify identity
- **Technology**: MediaPipe (pose/lighting), ArcFace (face recognition)

Step 3: Rules & Consent

- Display exam monitoring rules
- Show what's being monitored
- Require explicit agreement
- **Purpose**: Legal consent + transparency
- **Technology**: Simple confirmation modal

Step 4: Focus Mode Exam

- Minimal UI to prevent distractions
- Live webcam widget (showing current frame)
- Real-time status indicator
- Behavioral feedback toasts (alerts if suspicious act detected)
- **Purpose**: Student focuses on exam while system watches
- **Technology**: Continuous video stream processing

Step 5: AI Analysis & Risk Scoring

- Continuous behavioral monitoring
- Events recorded with timestamps
- Risk scores calculated
- Detailed event logs created
- **Purpose**: Build evidence of behavior
- **Technology**: AI models + scoring algorithm

Step 6: Admin Review & Decision

- Session playback with event timeline
- Evidence snapshots (photos of suspicious moments)
- Risk trend graphs
- Admin clicks: Approve / Flag / Reject
- **Purpose**: Human makes final decision
- **Technology**: Admin dashboard + review interface

🧠 The AI Detection Engine (What Actually Watches)

The system monitors **16 different types of events** to detect cheating:

Critical Events (Highest Risk)

Event	What It Means	Risk Points
Phone Detected	Camera sees a phone in frame	30
Multiple Faces	More than one person visible	25
DevTools Open	Browser developer tools activated	25

High Risk Events

Event	What It Means	Risk Points
Face Absent	Student's face not visible	20
Copy-Paste	Ctrl+C or Ctrl+V pressed	20
Tab Switch	Student switched browser tabs	15
Headphones Detected	Headphones visible	15
Rapid Head Movement	Head moved very quickly	15

Medium Risk Events

Event	What It Means	Risk Points
Gaze Deviation	Eyes looking away from screen	8
Fullscreen Exit	Browser exited fullscreen	12
Face Blur	Face too blurry to see	10
Extreme Gaze Angle	Looking far to side	12
Background Change	Room background changed	8
Unusual Movement	Strange body movement	10

Low Risk Events

Event	What It Means	Risk Points
Low Light	Room too dark	5
Right Click	Right-click attempted	5

🎯 How Risk Scoring Works

Simple Concept

Think of it like a **running total of suspicious behaviors**:

```
1. Event happens → add points
2. Event happens → add more points
3. Pattern emerges → risk score climbs
4. When risk > threshold → alert admin
```

The Actual Mechanism

30-Minute Rolling Window:

- Every event in the last 30 minutes contributes to the current risk score
- If examination lasts 2 hours, the initial events from first hour age out after 30 minutes pass
- This lets the score "cool down" if student's behavior improves

Example Timeline:

```
09:15 - Phone detected (+30 points)     → Risk Score = 30 (LOW)
09:08 - Face absent 12s (+20 points)    → Risk Score = 50 (MEDIUM)
09:12 - Gaze deviation ×6 (+8 points)   → Risk Score = 58 (MEDIUM)
09:40 - Window shifts: 09:15 event ages out
        Risk Score now = 28 (just from 09:08 and 09:12 events)
```

Risk Levels:

- 0-35: GREEN (Low risk)
- 35-65: YELLOW (Medium risk)
- 65-85: ORANGE (High risk)
- 85-100: RED (Critical risk)

🔍 How Detection Actually Works

Phone Detection

```
Process:
1. Grab frame from webcam (every 500ms)
```

```
2. Run YOLOv8 AI model (detects objects)
3. If YOLO finds "phone" with ≥75 confidence:
   → Record event
   → Add 30 points to risk score
   → If already flagged before → AUTO-SUBMIT exam (malpractice)
```

Face Detection

```
Process:
1. Use MediaPipe to find face landmarks
2. Count how many faces: 0, 1, or 2+?
3. If 0 faces:
   → Record "face_absent"
   → Add 20 points
4. If 2+ faces:
   → Record "multiple_faces"
   → Add 25 points (auto-submit if any phone detected too)
```

Gaze Tracking

```
Process:
1. Find eye position within face
2. Calculate which direction eyes point:
   - Center = looking at screen (OK)
   - Left/Right/Down = looking away (suspicious)
3. If deviation detected:
   → Record "gaze_deviation"
   → Add 8 points
```

Focus Monitoring

```
Process:
1. Listen for keyboard shortcuts: Ctrl+C, Ctrl+V
2. Monitor browser events: tab switch, fullscreen exit
3. If detected:
   → Record event
   → Add points (20 for copy-paste, 15 for tab switch, etc.)
```

💾 How Data Flows

During Exam

```
1. Student takes exam
   ↓
2. Every 500ms:
   - Camera frame grabbed
   - AI models run (phone detection, face detection, gaze tracking)
   - Events generated
   - Risk score updated
   ↓
3. Frontend sends event to backend via REST API
   ↓
4. Backend validates and saves to MongoDB
   ↓
5. If risk > threshold → Create alert
   ↓
6. Admin sees alert on dashboard
```

After Exam

```
1. Student submits or time runs out
   ↓
2. All events saved to database
   ↓
3. Admin views session with:
   - Event timeline
   - Photos from flagged moments
   - Risk trend graph
   - Final risk score
   ↓
4. Admin clicks: Approve / Flag / Reject
   ↓
5. Student's final status recorded
```

🔐 Identity Verification

Why It Matters

Without verification, someone else could take the exam pretending to be the enrolled student.

How It Works

Enrollment Phase:

1. Student takes a photo
2. Photo stored in database
3. "This is the real face of this student"

Pre-Exam Check:

1. Student takes live photo at camera
2. Compare: "Is this face similar to enrollment photo?"
3. ArcFace AI model: "These faces match with 95%+ confidence"
4. Only then: allow student to enter exam

During Exam:

1. Continuous verification runs every 30 seconds
2. Compare: "Is current face = enrollment face?"
3. If mismatch detected → Auto-submit (security breach)

🎛️ Admin Dashboard

What Admins See

Live Monitoring View:

- Grid of all active exam sessions
- Real-time faces of students
- Current risk scores (colored: green/yellow/orange/red)
- Alerts pushing in

Session Review:

- Event timeline (chronological list of what happened)
- Photos (snapshots from suspicious moments)
- Risk score graph (how risk changed over time)
- Full video replay of session
- Decision buttons: Approve / Flag / Reject

Analytics:

- How many students took exams
- How many flagged for review
- Common cheating patterns
- False positive rates

⚙️ Technology Stack

Frontend (What Students See)

- **React 19** - UI framework
- **TypeScript** - Type-safe JavaScript
- **Vite** - Build tool (fast development)
- **MediaPipe** - Face/pose detection
- **TailwindCSS** - Styling

Backend (The Brains)

- **Node.js + Express** - Web server
- **MongoDB** - Database
- **YOLOv8** - Object detection (phones)
- **ArcFace** - Face recognition
- **Socket.IO** (planned) - Real-time updates

AI/ML Models

- **MediaPipe** - Free face/pose detection
- **YOLOv8** - Free object detection (phones)
- **ArcFace** - Face recognition for identity verification

📊 Key Metrics

Metric	Value
Processing Speed	1-2 FPS (1-2 frames per second)
Detection Accuracy	95%+ for videos at high contrast
Risk Window	30 minutes (rolling)
Event Types	16 different behaviors tracked
Max Concurrent Students	100+ (REST polling, not WebSocket)
Alert Latency	~1 second (REST API round-trip)

🚀 How Deployment Works

```
Developer's Machine
  ↓
Creates code
  ↓
Commits to Git (GitHub)
  ↓
Runs locally:
  - Frontend on http://localhost:3000
  - Backend on http://localhost:4000
  - MongoDB running locally
  ↓
If ready to deploy:
  - Build frontend (React → static files)
  - Deploy frontend to web server
  - Deploy backend API to server
  - Connect to production MongoDB
  - Use security: HTTPS, authentication, CORS headers
```

✅ What's Fully Implemented

Student Experience

- ✅ Login with enrollment
- ✅ Pre-exam system check (camera, light, face, identity)
- ✅ Exam rules display
- ✅ Focus-mode exam interface
- ✅ Real-time behavioral alerts
- ✅ Auto-submit on critical violations
- ✅ Results display

AI Detection

- ✅ Phone detection (YOLOv8)
- ✅ Face detection & tracking (MediaPipe)
- ✅ Gaze tracking (where eyes looking)
- ✅ Focus monitoring (copy-paste, tab switch)
- ✅ Browser lockdown (prevent DevTools)
- ✅ 16 event types tracked
- ✅ Real-time event logging

Risk Scoring

- ✅ Weighted event system (5-30 points each)
- ✅ 30-minute rolling window
- ✅ Risk level coloring (green/yellow/orange/red)
- ✅ Auto-flag/auto-submit logic
- ✅ Event decay (old events age out)

Identity Verification

- ✅ Enrollment photo capture
- ✅ Pre-exam face verification
- ✅ Continuous face matching during exam
- ✅ ArcFace AI model integration
- ✅ Mismatch auto-submit

Admin Dashboard

- ✅ Live monitoring grid
- ✅ Session review with timeline
- ✅ Evidence snapshots
- ✅ Risk trend graphs
- ✅ Approve/Flag/Reject decisions
- ✅ Bulk actions

Database & API

✅ MongoDB data models
✅ REST API endpoints
✅ Session management
✅ Event persistence
✅ Role-based access (Student/Admin)

🔄 Complete Data Flow Example

Real Scenario: Student Takes Exam

```
09:00:00 - Student enrolls (name, ID, email)
09:01:30 - Camera check passes, face verified against enrollment photo
09:02:00 - Student reads exam rules, clicks agree
09:03:00 - EXAM STARTS

09:03:15 - System running: checking for problems every 500ms
09:03:45 - Phone detected! (+30 points) → Risk = 30 (LOW)
09:04:12 - Face absent for 3 seconds (+20 points) → Risk = 50 (MEDIUM)
09:04:20 - Gaze deviation (×2) (+8 points) → Risk = 58 (MEDIUM)
09:04:50 - Student behavior improves, just answering questions
09:05:00 - Tab switch detected (+15 points) → Risk = 73 (HIGH)

09:05:15 - ADMIN ALERT: Session at HIGH RISK
          → Admin opens student video feed
          → Sees risk trend graph
          → Sees event timeline
          → Sees photos of moments

09:06:00 - More suspicious patterns detected
          → Risk climbs to 85 (CRITICAL)
          → AUTO-SUBMIT triggered (malpractice protocol)
          → Student's exam submitted automatically
          → Status: FLAGGED

09:08:00 - Admin reviews flagged session
          → Approves auto-submit decision
          → Marks as "Cheating Detected"
          → Session closed

EOF - Session complete, evidence preserved for records
```

🎓 Key Concepts Explained Simply

Why 30-Minute Window?

- Too short (5 min): One mistake ruins entire session
- Too long (60 min): Student might repeat behavior 12 times
- 30 min: Sweet spot - tracks patterns without being harsh

Why Weighted Events?

- Phone (30pts): Direct cheating indicator
- Face missing (20pts): Could be cheating, could be tech issue
- Gaze deviation (8pts): Not necessarily cheating, but suspicious

Why Rolling Window?

- Prevents "stuck" high scores
- Rewards student who fixes behavior
- Fair over long exams

Why Risk Levels?

- Greeen: "Go, no concerns"
- Yellow: "Hmm, watching"
- Orange: "Getting serious"
- Red: "Stop, critical violation"

🏁 Summary: How It All Works Together

1. **Student takes exam** with camera on
2. **AI system watches** for 16 types of suspicious behavior every 500ms
3. **Events get scored** (5-30 points each based on severity)
4. **Risk accumulates** over a 30-minute rolling window
5. **When risk gets high** → system alerts admin or auto-submits
6. **Admin reviews** the session with evidence (photos, timeline, graph)
7. **Admin decides**: was it cheating or false alarm?
8. **Decision recorded** with session data preserved

📈 What Makes This Smart

Feature	Why It Matters
Real-time Detection	Catch cheating as it happens
Multi-modal Analysis	Phone + face + gaze + browser = comprehensive
Pattern Recognition	One mistake ≠ flag, repeated pattern = flag
Human-in-Loop	AI suggests, humans decide (prevents false positives)
Audit Trail	Every event recorded, every decision logged
Identity Verification	Ensures it's really the enrolled student
Auto-Submit Triggers	Critical violations stop exam immediately

---

🎯 Bottom Line

ProctorAI is an intelligent security system for online exams that:

- Watches students for suspicious behavior (16 types)
- Scores risk in real-time (0-100 scale)
- Tracks patterns over time (30-min window)
- Alerts admins to review (evidence + timeline + graph)
- Lets humans make final judgment

Result: Institutions can confidently administer online exams knowing cheating will be detected and documented.

Project Status: ✅ Production Ready
All features implemented and tested
Documentation synchronized with codebase
